

Magnitude-aware comparison: effect size, not just direction

A Opposition candidates: $|\log_2\text{FC}| \geq 0.5$ in BOTH arms, opposite directions, ≥ 3 groups each (n = 24; top 24 shown)

grey numbers = groups supporting the call (HIBI/GLP-1R)

B Global test, weighted by effect size (20,000 permutations)

Higher score = more net opposition. Observed sits $z = -3.40$ BELOW chance: weighting by magnitude makes the two arms look MORE concordant, not less.
Pearson $r = +0.083$ ($p = 6.6\text{e-}04$) vs Spearman $\rho = +0.051$; requiring $|\log_2\text{FC}| \geq 1.0$ in both arms leaves 34% opposite, i.e. 66% same direction.
