

Pathway-level comparison of the two conditions

HIBI (neonatal hypoxic-ischemic injury) vs GLP-1R agonism

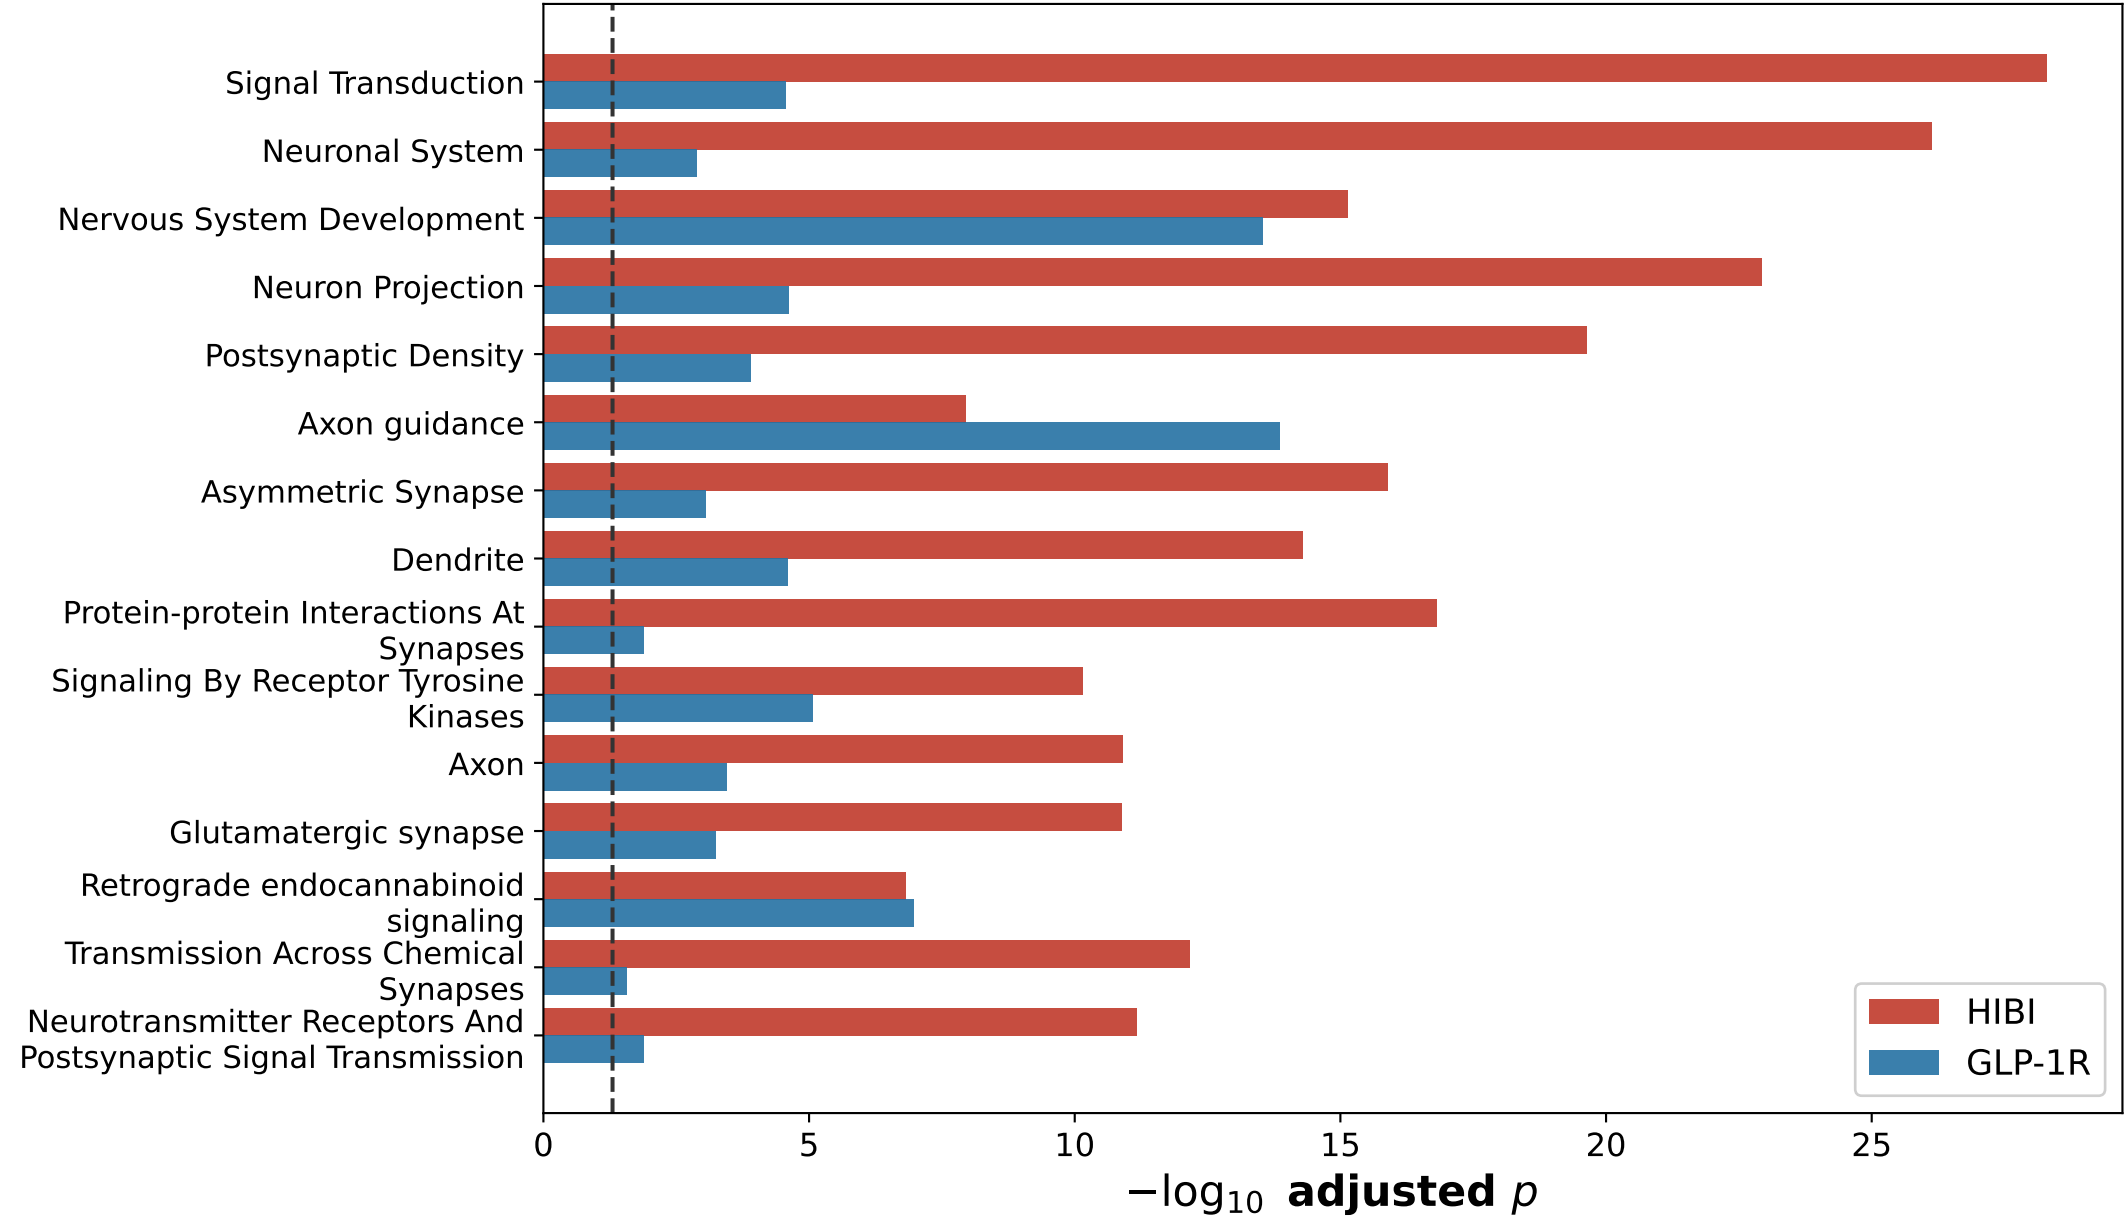

A Term overlap by database
85 shared overall (1.88× expected, $p = 1.4\text{e-}09$)

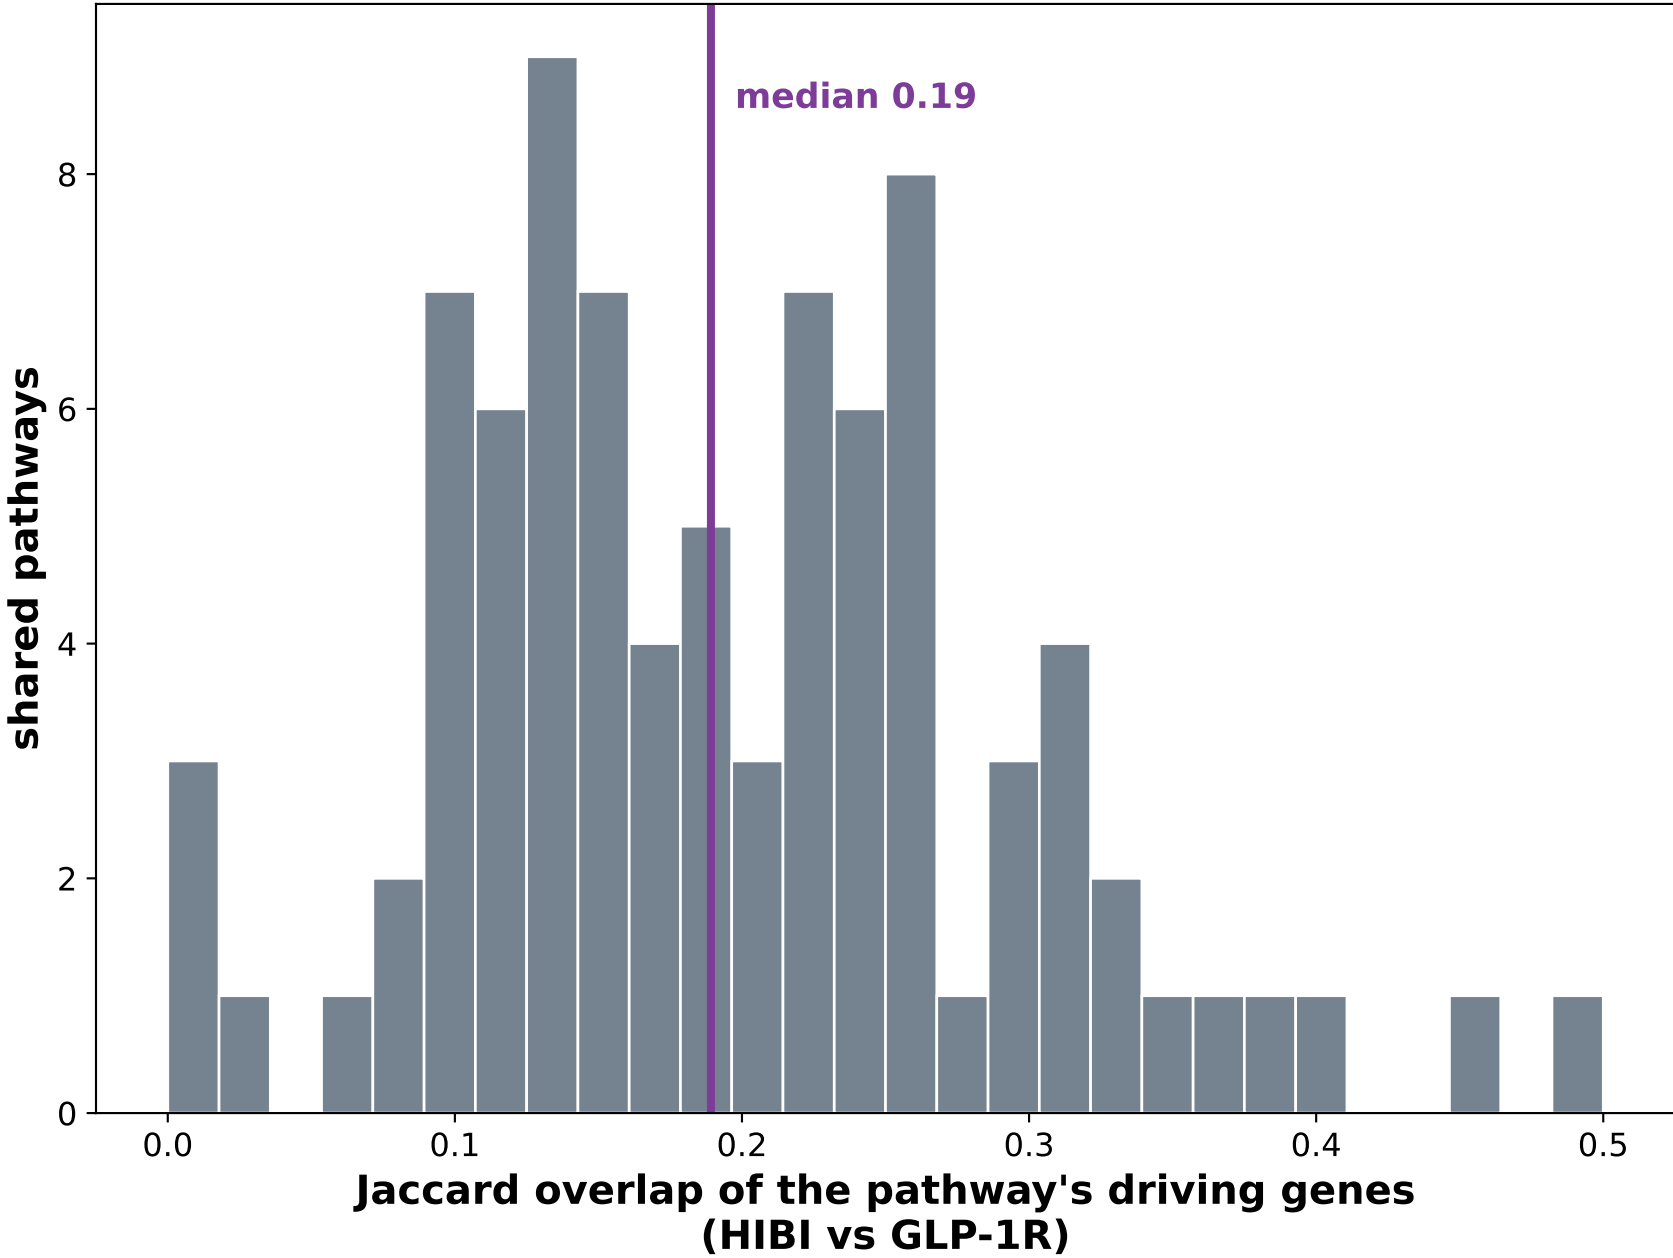

B Do shared pathways move the same way?

C Most significant shared pathways

D Same pathway, same genes?

Low Jaccard means the two conditions hit the same pathway through largely DIFFERENT member genes, which is itself a substantive result: shared enrichment does not imply a shared molecular route.
